Connecting VMGO to Your Learning Journey

KHYLLE JOSH BIONG PASTOR
36 minutes ago

Comment Like Actions

The Cebu Institute of Technology-University and the College of Computer Studies provide VMGO statements for setting the institution on what should become of us students in the future. This course, namely Design and Analysis of Algorithms, is a vehicle for developing "industry-preferred" and "globally competitive" Technologians. Learning about creating efficient algorithms with best possible performance aligns with the CCS' goal of producing a professional that exhibits creativity and innovation, as well as CIT-U's mission to guide students to become industry-preferred individuals.

Being a computer science student means having a responsibility to be more than just a "technician"; it requires one to be a value-driven and industry-preferred individual. These VMGO statements are not only for the institutions/departments to have basis, but it is also a guide for students on how to become a future ethic-abiding professional. As a Technologian being aligned to the CIT-U and CCS VMGO statements,
these principles shape my approach to problem-solving by pushing me to look beyond just "working code"; I must analyze and optimize my algorithms, treating every problem as an opportunity to practice the excellence expected of a CIT-U graduate.

As a student of this university and department, I aspire to be a student who integrates scientific knowledge with a purpose to serve for a better society. I want to become a competent professional who upholds the Culture of Excellence, an individual with integrity, and regard for welfare of people and nature. These goals align with my personal values in which I hope to be able to help my community in making long-term solutions to problems affecting them with an ethical mindset.

I see my academic journey in CS244 similar to that of the **Breadth-First Traversal** (BFS) algorithm. CIT-U teaches us level-by-level the concepts we need to learn, without going in too deep and skipping a step. The more levels we visit, the more we realize just how things connect at the end. It is aligned with their VMGO where we're built with strong foundations first before going through the complex stuff. *In order to guide learners to become industry-preferred and life ready professionals, we must first become university-preferred and lesson ready beginners.* We have to go through the fundamentals first before building real projects that impact real people.

The VMGO of CIT-U and CCS help guide me what and where the last level is (Vision), the levels that I have to go through first (Mission), and the specific nodes I have to enter to accomplish them (Goals). The graph to center of excellence is already there, and all I need to do to visit each step carefully. I'll keep trusting in their VMGO that no matter how daunting the path may be, we'll surely get there at the end.

What you have shared made me realize how we learned the concepts related to our program from the start until now... it is actually just like a BFS algorithm! We are first provided with the syllabus, which contains all the topics we will be discussing, then we delve into detail those topics provided, which all connects eventually at the end of the course. This analogy made me feel a bit assured that even though learning our future concepts will be hard, everything will be okay at the end.

During our OOP capstone with friends, we set a clear division of labor to manage the workload properly. Each of us took roles based on our strengths, so yeah, no one was too overwhelmed or lost. We focused on our own tasks. This helped us avoid duplicate work and cover all needed parts, which helped us move faster and stay organized.

Core Value(s) Involved: **Teamwork and Universality**

Explanation: We showed teamwork and universality by respecting every member's role, sharing updates, and helping when someone needed support. This kept the workflow smooth, reduced errors, and allowed us to finish on time. It wasn't just for the sake of fair distribution but for efficiency and coordination too, and without such, the project quality and outcome would've suffered a lot.

This situation is proof that it is truly important to have proper communication in group-related projects to make sure there will be no confusion in working on each of the assigned tasks. Setting a clear objective for each member is a great move in ensuring that your project will be smooth sailing without any problems along the way.
